

A Dentist Exposes the Root Canal Cover up

May 29, 2014

IS THERE A TOXIC TIME-BOMB IN YOUR MOUTH?

One of the most feared dental procedures is the root canal. It can also be one of the most painful. For the thousands of people who have them, most people are unaware of the danger that it may pose to their health. More than 25 million root canals are performed each year in the United States.

What is a root canal?

A root canal is a procedure where the dentist drills through the dentin, into the pulp chamber to remove infected pulp along with the tooth's nerve, artery, vein and tendon. The canals of this now dead tooth are filled with a combination of rubber and heavy metals (gutta percha) and a crown is installed frequently with water-soluble adhesive.

What are the issues with root canals?

Anaerobic bacteria culture in the tooth with a slurry of heavy metals from the gutta percha which releases into the blood stream causing mild to serious health conditions such as MS, ALS and even cancer. Dr. George Meinig, DDS wrote a book called "The Root Canal Cover Up" which addresses the issues of root canals. In this book he discusses an extensive research study in which 5,000 animals were involved. The research revealed that bacteria and toxins were able to enter the blood from around the bony socket of the tooth. They were also able to show how these organisms were responsible for a high percentage of the chronic and degenerative disease conditions that are epidemic in America.

Approximately 25% of the population have strong immune systems and are able to live symptom free after a root canal for up to several years, before some chronic condition has had enough time to develop. However, there are approximately 75% who's immune systems have been compromised through poor nutrition, accidents, illnesses, stress, etc. These are the individuals who develop symptoms that cause them to go from doctor to doctor in attempts to find answers to their maladies. A high percentage of these cases are due to the bacteria coming from their root canal filled teeth, or from tooth extractions or other biofilms.

Recently, Dr. Robert Jones discovered a very high correlation between root canals and breast cancer. He performed a five-year study of 300 breast cancer patients, which showed that 93% of the women with breast cancer had root canals. Seven percent had other dental issues. An interesting note was that tumors, in most cases, manifested on the same side of the body as the root canal(s) or where dental restoration was performed. Dr. Jones research determined that toxins from the bacteria and heavy metals in the infected tooth and jawbone may inhibit the body's natural ability to suppress tumor development.

My personal story is similar. I was diagnosed with thyroid cancer in 2000. The cancerous nodule was located on the right side of my thyroid gland. I had one root canal tooth in my mouth that was located in a right lower molar. When fighting cancer naturally, I had 11 amalgam fillings removed along with pulling the root canal tooth. When extracted my dentist noted that there was black sludge under the tooth along with necrosis of the jawbone. It was after I cleaned up my mouth that I began to experience a more rapid healing from cancer.
